Individual Converting Machines for Rotary Cutting

The Spilker GmbH will present its comprehensive range of converting machines and rotary tools also at this year's ICE trade fair. On the 72 m² exhibition stand no. 1230 in hall 5, a machine of the S-CON series specially developed for the event will be in focus.

Designed for the rotary processing of a wide variety of materials, the converting machine offers extensive production possibilities in order to realize even sophisticated and complex processing processes. We will show functions such as the shifting of cut-out parts on a new liner in order to enlarge the distance between the parts. This process saves material and is therefore useful when processing expensive materials.

Another component of the machine is a double cutting unit with two cutting tools in V-arrangement. Thanks to its mechanical register, the V-cutting unit enables perfectly accurate cutting with two tools.

In addition to the tool and machine solutions shown, Spilker also offers the opportunity to test brought-in materials on-site for suitability for rotary die-cutting and the cutting behavior.

On the basis of the result, you will receive comprehensive process and application advice, from the individual tool for rotary processing up to the individual planning of a rotary cutting and converting machine.
